

Hydro Centaur Pipeline Deployment

Hydro's [Centaur](#) recently deployed a new installation across a pipeline in the Midwest US, demonstrating the continuing growth of demand for smart condition monitoring solutions.

The pipeline end user chose Centaur over other options under consideration because Hydro has the subject matter expertise behind the equipment being monitored. This distinction allows Hydro to not only be a monitoring partner, but to be a partner in reliability across the equipment life cycle.

With Centaur's real-time data, the end user is able to proactively service their equipment and identify incipient issues before they develop into greater problems. Through a collaboration between the pipeline team and Hydro Centaur's dedicated monitoring engineers, any problems that are identified will receive a comprehensive root cause analysis and proposed modifications will be developed to prevent problem reoccurrence. These solutions can be implemented through Hydro's extensive [global service network](#) and, if necessary, tested in a controlled environment in Hydro's [Performance Test Lab](#).

We are proud to support our customers with services and solutions that drive measurable results.
